MindCache

Your Personal Browser Memory Engine

Cognis

Humans remember ideas.
Browsers remember URLs.

We Consume More Than We Remember.

Everyday we read Read articles, Watch YouTube videos, Browse GitHub repositories, Open PDFs and research papers ...

But days later we remember ~

"that rust pdf parser"
"that paper about transformers"
"that youtube video explaining RAG"

We do **NOT** remember ~ URLs, Titles or Bookmarks

Current Solutions ? Browser History, Bookmarks, Open Tabs ...

BUT Knowledge is found once and then lost.

Introducing MindCache ...

You Search For ~

“that video about RAG pipelines”

MindCache instantly retrieves ~

“Is RAG Still Needed? Choosing best LLM approach.”
“What is Retrieval-Augmented Generation (RAG)?”

All from your history ...

Tracks Valuable Content

Extracts Knowledge

Builds A Personal Knowledge Base

Allows natural language search

There are two YouTube videos regarding RAG pipelines and their implementation. One video features IBM Senior Research Scientist Marina Danilevsky, who explains the RAG framework and how it improves LLM results by providing the model with the most trustworthy, up-to-date facts and allowing users to see the sources of the information [1]. Another video featuring Martin Keen compares RAG against long context windows in LLM workflows, specifically exploring the impact of embedding models, semantic search, and vector databases on AI performance [2].

What Makes MindCache Different?

Search By Memory, Not Keywords - Instead of remembering exact titles, links, or filenames, users can search using what they remember.

Private & Local First - All AI processing, indexing, and search run entirely on the user's machine. No CLOUD. No TRACKING. No DATA LEAKS.

Understands Multiple Content Types - Websites, YouTube videos, GitHub repositories, PDF Documents ~ nothing is incomprehensible.

Builds Personal Knowledge - MindCache doesn't store links. It stores understanding. keywords, entities, relationships and concepts becomes searchable.
